

# Data manipulation in R

A program to use when size matters

Peter Shaw

September 30, 2015

# Why use R?

## Why not use a spreadsheet?

### Today's workshop

- A common scenario
- A friend has emailed you her data in a spreadsheet
- Today's workshop is about how to get started.
- It's not about impressing with R code

### Why not use a spreadsheet?

- Data manipulation in Excel is VERY risk and time consuming
- A range of software packages are available for Excel
- Large data sets can exceed the size limits of standard programs
- Spreadsheets don't have the inherent understanding of statistics that R has
- For example handling of NA's
- R is hot!

# Why use R?

## Why use R?

- R is free
- R is available on most operating systems Windows, OS X, Linux
- There are huge numbers of packages available
- Its becoming the international standard for statistics

# Getting Started

## Some References

James P. Howard.

# Getting Started

Today's Files

## Workshop files on Github

<https://github.com/pechang03/SizeDoesMatter>

- The slides. **main.pdf**
- The handouts **handout.pdf**
- The R code **SizeDoesMatterEg.R**
- The spreadsheets
  - 1\_RWkshp\_dummydata\_OTUtable.xlsx
  - 2\_RWkshp\_dummydata.EnvData\_incl2outliersMK.xlsx
  - 3\_Followupdatafromcontaminatedsite\_MK.xlsx

# Getting Started

## Installing R!

### Download it

- Open <http://www.r-project.org>
- Click CRAN (Under download on Top Left)
- Click <http://cran.ms.unimelb.edu.au/> University of Melbourne

### Windows

- Select Windows
- Select Base
- Download R (suggest latest version)

### OS X

- Select Select OS X
- Select R-3.2.2.pkg (or the version that matches your OS version)

# Getting Started

## Installing a GUI

### How about RStudio

- <https://www.rstudio.com/products/rstudio/download/>
- Its also on your thumb drive

# Getting Started

## Basic steps

```
2+5
```

```
## [1] 7
```

```
# Create a sequence of numbers
```

```
X = 2:10
```

```
# Display basic statistical measures
```

```
summary(X)
```

```
##      Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##         2         4         6         6         8        10
```

```
# use q() to quit
```

# Getting Started

## Help Functions

### To access the documentation type

```
help.start()  
help(summary)  
args(summary)  
example(sd)  
??package
```

# Help Functions

Search the Web

## To search R documentation

- `RSiteSearch("key phrase")`
- `help(adf.test, package="tseries")`
- To search for a tutorial for a package  
`vignette(package="packagename")`
- For an intro to vignettes see  
<https://cran.r-project.org/web/packages/sos/vignettes/sos.pdf>
- Examples on the web  
<http://shiny.rstudio.com/gallery/>

## Custom Google search focused on R-specific websites

<http://rseek.org>

## Coding Q&A site

<http://stackoverflow.com> <http://stats.stakexchange.com>

# Iterative development

## Working Creatively

Research on how to work creatively based on case studies of successful R&D projects developed into Agile

- Keep the 'manager' away
- Work sustainably
- People over process
- Iterative development

# R Data types

Lists, frames and tables

## Vectors

- Vectors `l ← c(1,3,4,7,11)`
- Refer to elements using array `l[c(2,5)]` 2nd and 5th elements of `l`

## Data Frames

```

a <- c(35,23,24,65)
e <- c("Peter", "John", "Mark", NA)
f <- c(TRUE,TRUE,TRUE,FALSE)
team <- data.frame(a,e,f)
names(team) <- c("Age","Names","Passed") # variable names
str(team)

## 'data.frame': 4 obs. of 3 variables:
## $ Age : num 35 23 24 65
## $ Names : Factor w/ 3 levels "John","Mark",...: 3 1 2 NA
## $ Passed: logi TRUE TRUE TRUE FALSE

```

# Let's read the first table

Check the current directory

## Where are we

```
getwd()  
setwd("/Users/pcru/SizeDoesMatter1")  
dir() #This lists the files  
ls()  #This lists the variables
```

<http://www.statmethods.net/input/contents.html>

# Reading a table from a file

Reading an excel table

To read a csv table as a table try

```
tab1 ← as.matrix(read.csv(file="filetable.csv", sep=",", header=FALSE))
```

But our table is an excel file

- What about a package?
- <http://www.thertrader.com/2014/02/11/a-million-ways-to-connect-r-and-excel/>
- Installing the R package xlsx
- CRAN mirror <http://cran.csiro.au>
- Change in preferences

## Where from

- install command
- `install.packages(pkgs)`

## Citing Packages

- Citing packages
- Getting the bibtex entry into endnote
- [http://www.lib.uts.edu.au/question/5955/  
how-can-i-import-bibliography-endnote-bibtex-latex-what-about-conve](http://www.lib.uts.edu.au/question/5955/how-can-i-import-bibliography-endnote-bibtex-latex-what-about-conve)

```
x<-citation()
x1<-citation(package="RSQLite")
toBibtex(x)
```

```
sessionInfo()
packages_in_use <- c( sessionInfo()$basePkgs, names( sessionInfo()$loadedOnly ) )
the_citations_list <- lapply( X=packages_in_use, FUN=citation )
the_citations_list
```

# Reading an excel table

An example

```
table1<-read.xlsx2("1_R_Wkshp_dummy_data_OTU_table.xlsx", sheetName =  
"Sheet1", header=FALSE, rowNames=FALSE, transpose=TRUE, endRow=18)
```

## Loading the xlsx package

```
## Loading required package: xlsx  
## Warning: package 'xlsx' was built under R version  
3.1.3  
## Loading required package: rJava  
## Warning: package 'rJava' was built under R version  
3.1.3  
## Loading required package: methods  
## Loading required package: xlsxjars  
## Loading required package: xtable
```

# Reading an excel table

The columns types are wrong

	X1	X2	X3	X4	X5	X6	X7
1	Group	Contaminated					
2	Site	1			2		
3	Sample ID	10000	10001	10002	10003	10004	10005
4	Rep	1	2	3	1	2	3
5	phormidiaceae	24872	24872	5822	7538	7201	7538
6	streptococcaceae	11	7	14	8	10	8

# Reading an excel table

Transpose the table

## Transposing

We need to transpose the table and set the column names correctly

```
table1t=setNames(data.frame(t(table1[,-1])),table1[,1])
```

[http://rgm3.lab.nig.ac.jp/RGM/R.rdfile?f=Ecdat/man/read.transpose.Rd&d=R\\_CC](http://rgm3.lab.nig.ac.jp/RGM/R.rdfile?f=Ecdat/man/read.transpose.Rd&d=R_CC) <http://stackoverflow.com/questions/17288197/reading-a-csv-file-organized-horizontally>

# Fields across many columns

Replicating first column

## TDD – First do it the easy way first

```
ctridx<-which(table1t$Group=="Control")
table1t$Group[1:48]<-"Contaminated"
table1t$Group[(ctridx+1):48]<-"Control"
```

```
ttt<-table1t$Site
for(i in c(2:length(table1t$Site)))
{
  temp<-as.character(table1t$Site[i])
  tempb<-as.character(ttt[i-1])
  if (table1t$Site[i]=="")
  {
    ttt[i]<-tempb
  }
  if (!table1t$Site[(i)]=="")
  {
    ttt[i]<-temp
  }
}
table1t$Site<-ttt
```

```
## X3
## 1
## Levels: 1 2 3 4 FALSE TRUE
```

# How to work with strings

## stringr package

- `require(stringr)`

A look at the stringer package

- `stri_c(str1, str2)`

concatenates two string

- `str_len(str)`

```
require(stringr)
```

```
## Loading required package: stringr
```

```
table1t$Rep<-str_replace(table1t$Rep,"[rep]{3}?", "\\1")  
table1t$Rep<-str_replace(table1t$Rep,"A", "1")  
table1t$Rep<-str_replace(table1t$Rep,"B", "2")  
table1t$Rep<-str_replace(table1t$Rep,"C", "3")  
table1t$Rep<-as.factor(table1t$Rep)
```

# Reading Tables

Reading a table of other types

- `http://www.statmethods.net/input/importingdata.html`
- `http://stackoverflow.com/questions/17288197/reading-a-csv-file-organized-horizontally`
- `http://rgm3.lab.nig.ac.jp/RGM/R_rdf.html?f=Ecdat/man/read.transpose.Rd&d=R_CC`
- Input files from Stata

```
library(foreign)
mydata <- read.dta("c:/mydata.dta")
```

# Morning Tea Time

Back in 20min

**Need coffee !!**

# Let's read the next table

Reading a table using xlsx

```
setwd("/Users/pcru/SizeDoesMatter1")
```

```
#dir()
```

```
table2<-read.xlsx2("2_R Wkshp_dummy data_Env Data_incl2outliersMK.xlsx",
```

	Group	Site	Sample.ID	Rep	Spill.date	Sample.collection.date
1	Contaminated	1	10000	1	14-May-14	15.5.14
2	Contaminated	1	10001	2	14-May-14	15.5.14
3	Contaminated	1	10002	3	14-May-14	15.5.14

5	Contaminated	2	10004	2	14-May-14	15.5.14
6	Contaminated	2	10005	3	14-May-14	15.5.14

# Reading the next table

Reading a table I

Oh NO

- All columns have been set to factors
- Dates have different formats

```
str(table2[,1:11])
```

```
## 'data.frame': 48 obs. of 11 variables:
```

```
## $ Group : Factor w/ 2 levels "Contaminated",...: 1 1 1 1 1
```

```
## $ Site : Factor w/ 4 levels "1","2","3","4": 1 1 1 2 2 2
```

```
## $ Sample.ID : Factor w/ 18 levels "10000","10001",...: 1 2 3 4
```

```
## $ Rep : Factor w/ 9 levels "1","2","3","A",...: 1 2 3 1 2 3
```

```
## $ Spill.date : Factor w/ 2 levels "14-May-14","N/A": 1 1 1 1 1
```

```
## $ Sample.collection.date: Factor w/ 4 levels "15.5.14","17/5/14",...:
```

```
## $ labnum : Factor w/ 36 levels "2000","2001",...: 1 2 3 4 5
```

```
## $ phosphate..ppb. : Factor w/ 39 levels "10","105","108",...: 27 3
```

```
## $ ammonia..ppb. : Factor w/ 41 levels "10","103","1042",...: 10
```

```
## $ chlorophyll..ug.L. : Factor w/ 38 levels "1","10","11",...: 20 23
```

```
## $ DO.... : Factor w/ 31 levels "100","120","31",...: 5 4 3
```

# Reading the next table

Reading a table II

## Break it down

First read a few rows only

```
table2 <- read.xlsx2("2_R Wkshp_dummy data_Env Data_incl2outliersMK.xlsx", sheet = "Sheet1",
  header = TRUE, rowNames = FALSE, as.Data.frame = FALSE, colIndex = c(1:5),
  stringsAsFactors = FALSE, colClasses = c("character", "numeric", "numeric",
    rep("character", 2)), endRow = 4)
supply(table2, mode)
```

```
##      Group      Site  Sample.ID      Rep  Spill.date
## "character" "numeric" "numeric" "character" "character"
##      rowNames as.Data.frame
##      "logical"      "logical"
```

```
supply(table2, class)
```

```
##      Group      Site  Sample.ID      Rep  Spill.date
## "character" "numeric" "numeric" "character" "character"
##      rowNames as.Data.frame
##      "logical"      "logical"
```

# Reading the next table

Setting the data types

## colClasses

- The variable `colClasses` can be used to specify the row types.
- We need to set **`stringsAsFactor=FALSE`** or all columns will be loaded as factors
- The dates are in a non-standard format so we need to read them as chars first

```
table2b<-read.xlsx2("2_R Wkshp_dummy data_Env Data_incl2outliersMK.xlsx",
sheetName = "Sheet2",header=TRUE,rowNames=FALSE,as.Data.frame=FALSE,
colIndex=c(1:11),stringsAsFactors=FALSE,
colClasses=c("character",rep("numeric",2),"character",rep("character",2),
supply(table2,class))
```

```
##      Group      Site Sample.ID      Rep Spill.date
## "character" "numeric" "numeric" "character" "character"
##      rowNames as.Data.frame
##      "logical" "logical"
```

## Reading table 2

Setting the Date Type

```

table2f <- table2
table2f$Spill.date <- as.Date(table2f$Spill.date, "%d-%b-%y")
table2f$Sample.collection.date <- as.Date(table2f$Sample.collection.date

## Error in
as.Date.default(table2f$Sample.collection.date,
"%d.%m.%y"): do not know how to convert
'table2f$Sample.collection.date' to class "Date"

# sapply(table2f,mode)
sapply(table2f, class)

##      Group      Site Sample.ID      Rep Spill.date
## "character" "numeric" "numeric" "character" "Date"
##      rowNames as.Data.frame
##      "logical"      "logical"

```

## Reading table 2

Setting the Date Type Correctly

### colClasses

- The `as.Date` method can take a format string as the second variable
- The format strings are described in help on `strptime`
- But `Spill.data` has **two formats**
- We can use the `if else` function to combine them

```
table2bf<-table2b
table2bf$Spill.date<-as.Date(table2bf$Spill.date,"%d-%b-%y")
cdate1<-as.Date(table2bf$Sample.collection.date,"%d.%m.%y")
cdate2<-as.Date(table2bf$Sample.collection.date,"%d/%m/%y")
table2bf$Sample.collection.date<-as.Date(ifelse
(!is.na(cdate1),as.Date(cdate1),as.Date(cdate2)), origin="1970-01-01")
table2bf$Group<-as.factor(table2bf$Group)
table2bf$Rep<-as.factor(table2bf$Rep)
dated<-table2bf$Sample.collection.date-table2bf$Spill.date
```

# Reading table 2

Setting the Date Type Correctly

## Count the NAs

```
na_count <-sapply(table2bf, function(y) sum(length(which(is.na(y))))))
na_count
```

```
##           Group           Site           Sample.ID
##           0             0             0
##           Rep           Spill.date Sample.collection.date
##           0             24             0
##           labnum        phosphate..ppb.        ammonia..ppb.
##           0             0             0
##           chlorophyll1..ug.L.        DO....        rowNames
##           0             0             0
##           as.Data.frame
##           0
```

## Reading table 2

Just fix the Rep column using the stringr package again

```

require(stringr)
table2bf$Rep<-str_replace(table2bf$Rep,"[rep]{3}?", "\\1")
table2bf$Rep<-str_replace(table2bf$Rep,"A", "1")
table2bf$Rep<-str_replace(table2bf$Rep,"B", "2")
table2bf$Rep<-str_replace(table2bf$Rep,"C", "3")
table2bf$Rep<-as.factor(table2bf$Rep)
str(table2bf)

## 'data.frame': 48 obs. of 13 variables:
## $ Group      : Factor w/ 2 levels "Contaminated",...: 1 1 1 1 1
## $ Site       : num 1 1 1 2 2 2 1 1 1 2 ...
## $ Sample.ID  : num 10000 10001 10002 10003 10004 ...
## $ Rep        : Factor w/ 3 levels "1","2","3": 1 2 3 1 2 3 1 2 3
## $ Spill.date  : Date, format: "2014-05-14" "2014-05-14" ...
## $ Sample.collection.date: Date, format: "2014-05-15" "2014-05-15" ...
## $ labnum      : num 2000 2001 2002 2003 2004 ...
## $ phosphate..ppb. : num 3020 3253 3169 2999 2879 ...
## $ ammonia..ppb.  : num 13880 14598 14676 10984 11657 ...
## $ chlorophyll..ug.L. : num 302 323 315 352 289 296 254 248 250 220
## $ DO....       : num 34 33 31 38 36 34 40 38 41 45 ...

```

# How to merge two data sets?

Using the merge command

## The inbuilt command merge

- R has a command merge
- To begin, start looking at the first 9 lines of the tables and merge them
- Need to use Group, Site, Sample.ID because otherwise it's not unique

```
merge(x, y, by = intersect(names(x), names(y)),
      by.x = by, by.y = by, all = FALSE, all.x = all, all.y = all,
      sort = TRUE, suffixes = c(".x", ".y"),
      incomparables = NULL, ...)
```

```
tab1c<-table1t[1:9,]
tab2c<-table2b[1:9,]
m1<-merge(tab1c,tab2c,by.x="Sample ID",by.y="Sample.ID")
m2<-merge(table1t,table2bf,by.x=c("Group","Site","Sample ID"),
by.y=c("Group","Site","Sample.ID"))
m3<-merge(table1t,table2bf,by.x=c("Group","Site","Sample ID","Rep"),
by.y=c("Group","Site","Sample.ID","Rep"))
```

# Lunch Time

Back in 30 min

Provided

# How do I append two data sets?

To begin load the third data set

## Follow up data from contaminated site

```

table3<-read.xls(x2("3_Follow up data from contaminated site_MK.xls"),
  sheetName =" Sheet1", header=TRUE,rowNames=FALSE,
  colClasses=c(rep("character",3),

rep("character",2),rep("numeric",18)))
table3f<-table3
table3f$Spill.date<-as.Date(table3f$Spill.date,"%d.%m.%y")
table3f$Sample.collection.date<-as.Date(table3f$Sample.collection.date,"%d.%m.%y")
sapply(table3f,mode)
sapply(table3f,class)

```

# How do I append two data sets?

Loading the third data set

## Joining table 3 to the other merged tables

- We need to be careful to match everything
- Install the **plyr** package This has lots of useful functions for renaming var etc
- This means we need columns for corynebacteriaceae and porphyromonadaceae
- Should these values be NA or 0?
- We will do one of each.
- Generally we would use NA but in this case 0 is better as its likely the rows were missing as none were detected

# How do I append two data sets?

## Appending the third set

```

require( plyr )
Sample.ID←rep(20000,3)
table3fi←cbind( table3f , Sample.ID )
#how many columns I can't count
ncol( table3fi )
ncol( m3 )
#now get the cols all right
table3fii←table3fi [ c(1,2,24,3,4:23) ]
m3i←m3[ c(1:4,19:20,5:18,21:26) ]
setdiff( names( m3i ) , names( table3fii ) )
m3i←rename( m3i , c( " Sample ID" = " Sample.ID" ) )
corynebacteriaceae←rep( 0 , nrow( table3fii ) )
porphyromonadaceae←rep( NA , nrow( table3fii ) )
table3fiii←cbind( table3fii , corynebacteriaceae , porphyromonadaceae )
setdiff( names( m3ii ) , names( table3fiii ) )

m3ii[ , c(7:24) ] ← sapply( m3ii[ , c(7:24) ] , as.numeric )
m3ii[ , c(1:4) ] ←sapply( m3ii[ , c(1:4) ] , as.character )
#m3ii[ , c( " Site " ) ] ←sapply( m3ii[ , c( " Site " ) ] , as.character )

table3fiii[ , c(1:4) ] ← sapply( table3fiii[ , c(1:4) ] , as.character )
table3fiii[ , c(7:24) ] ← sapply( table3fiii[ , c(7:24) ] , as.numeric )
table4←rbind( m3ii , table3fiii )
table4[ ,1] ← sapply( table4[ ,1] , as.factor )

```

```
## Loading required package: plyr
```

```
## [1] 24
```

```
## [1] 27
```

# Another Break

## reshape2

- `vignette(reshape)` doesn't work
- try <http://had.co.nz/reshape/>
- and <http://seananderson.ca/2013/10/19/reshape.html>

## A small example for melt

- Suppose we want a box plot to see if there are outliers
- We will use `ggplot2` box plot
- The box plot needs data in long format.
- To use this first **melt** the data
- We need to specify the unique key, the variable name and the value name
- The key is not unique.
- Then plot it

# Reshaping Tables

melt and boxplot

## The code

```
matable4<-melt(table4[,c(1:4,6:25)],variable.name = "microbe",  
value.name ="abundance", id=c("Group","Site","Sample.ID","Rep"),  
factorsAsStrings=FALSE,rm.na=TRUE)
```

```
require(reshape2)
```

```
## Loading required package: reshape2
```

```
matable4<-melt(table4[,c(1:4,7:25)],variable.name = "microbe",  
value.name ="abundance", id=c("Group","Site","Sample.ID","Rep"),  
factorsAsStrings=FALSE,rm.na=TRUE)
```

# Reshaping Tables

Boxplot cont

## Using ggplot

- As we have keys we need to specify the x and y
- Let's make the sites different colors
- The variable names are long so flip it with *coord\_flip()*
- Looks like we have outliers...hmm

```
require(ggplot2)
```

```
## Loading required package: ggplot2
```

```
ggplot(matable4, aes(x=microbe, y=abundance, fill=Site)) + geom_boxplot()
```

```
## Warning: Removed 24 rows containing non-finite values (stat_boxplot).
```

# Finding Outliers

Interquartile range

## Finding Outliers

- Outliers are defined 1.5 times the interquartile range above the upper quartile
- Assume that rows 12 and 14 in phosphate are errors as the 9 is typed twice
- Still issues with ammonia to explore

```
phosphate<-table4[, "phosphate..ppb."]  
upper.limit <- quantile(phosphate)[4] + 1.5*IQR(phosphate)  
lower.limit <- quantile(phosphate)[2] - 1.5*IQR(phosphate)  
#table4[phosphate> upper.limit, c("Site", "phosphate..ppb." )]
```

# Reshaping Tables

## Finding Outliers

## Removing Outliers

	Site	phosphate..ppb.
1	1	3020.00
2	1	3253.00
3	1	3169.00
12	1	9982.00
14	1	9982.00
16	1	1542.00

```
table4[12,"phosphate..ppb."]<-982  
table4[14,"phosphate..ppb."]<-982
```

# Outliers check

Redo the boxplot

Look again ggplot

## Warning: Removed 24 rows containing non-finite values (stat\_boxplot).

## RSQLite

- Suppose merge is not enough? I know about SQL and want to do joins
- Install RSQLite
- We also need to install DBI

```
## Loading required package: RSQLite
```

```
db <- dbConnect(SQLite(), dbname="Test.sqlite")
#getConfig()$staged.queries
# sqldf(attach "Test1.sqlite" as new)
dbBegin(db)

## [1] TRUE

dbWriteTable(db, "table1", table1t, overwrite=TRUE)

## [1] TRUE

dbReadTable(db, "table1")
```

## RSQLite

- Some links to RSQL ideas
- <http://stackoverflow.com/questions/12307685/join-more-than-2-tables-in-r-using-rsqlite>
- <https://support.rstudio.com/hc/en-us/articles/201057987-Quick-list-of-useful-R-packages>
- <https://cran.rstudio.com/web/packages/dplyr/vignettes/introduction.html>

```
select coalesce(fileA , fileB), valA , valB
      from t1 LEFT OUTER JOIN t2 On t1.fileA= t2.fileB
UNION select coalesce(fileA , fileB), valA , valB
      from t2 LEFT OUTER JOIN t1 ON t1.fileA= t2.fileB
(CREATE TABLE all_files AS SELECT fileA FROM t1 UNION SELECT fileB from t2 UNION
```

Another important component of TDD is refactoring and unit tests

- Refactoring <http://refactoring.com/>
- <http://www.r-bloggers.com/my-experience-of-learning-r-from-basic-graphs-to-performance-tuning>
- TDD in R <http://www.slideserve.com/andrew/test-driven-development-in-r>
- Version Control tortoiseSVN <http://tortoisesvn.net/>
- GitHub <https://github.com/>

# Dropping row and columns

Dropping selected variables

## Dropping Row and Columns with too many NAs

```
numNAs_inData4_rows ← apply(rawData4, 1, function(z) sum(is.na(z)))  
numNAs_inData4_col ← apply(table4, 2, function(z) sum(is.na(z))) # count NAs in D  
lessThan20 ← table4[!(numNAs_inData4_rows > 20),] #only select the rows contain  
lessThan20col ← table4[,!(numNAs_inData4_col > 20)]
```

# Dropping row and columns

Dropping selected variables

## Tidy Data

In tidy data:

- Each variable forms a column.
- Each observation forms a row.
- Each type of observational unit forms a table.
- <https://cran.r-project.org/web/packages/tidyr/vignettes/tidy-data.html>
- <http://pj.freefaculty.org/R/Rtips.html#toc-Subsection-1.11>

## Spit out the dates and numbers

```
dates4<-table4[,c(5,6)]  
abundance<-table4[,c(7:25)]
```

# Adding a new column

## Calculating the number of days

### Calculating the number of days

We can just subtract as.Date fields

```
dates4<-table4[,c(5,6)]  
abundance<-table4[,c(7:25)]  
days<-dates4[,2]-dates4[,1]
```

# Setting the relative abundance

Normalizing data

## supply

- Also known as centring the data
- Ecological percentage of the sum of the variables
- We can use sweep to centre the data
- `options(digits = 1)` Just to make things pretty

```
sweepOutContinu←sweep(abundance, 2, apply(abundance, 2, min, na.rm=TRUE))
afterSweepContinu←sweep(sweepOutContinu, 2, apply(sweepOutContinu, 2, max, na.rm=TRUE))
table5←cbind(table4[, c(1:6)], afterSweepContinu, days)
options(digits=1)
sweep(abundance, 2, colSums(abundance), FUN="/")
scale(abundance, center=FALSE, scale=colSums(abundance))
```

# Now let's have some fun

## Graphics in R

### R has nice graphs

- A graphical output
- <http://rcharts.io/gallery/>
- R Graph gallery currently down try <http://rgraphgallery.blogspot.com/>
- A reference on where to go R thumbnails
- ggplot2 (scatter plot of 2 var and then 3 plots)
- To create a correlation heat map

```
library(corrplot)
abuncor<-cor(t5lessThan20col[,c(6:22)])
require(corrplot)
corrplot(abuncor, method = "circle")
```

```
## [1] 23
```

```
## Loading required package: corrplot
```

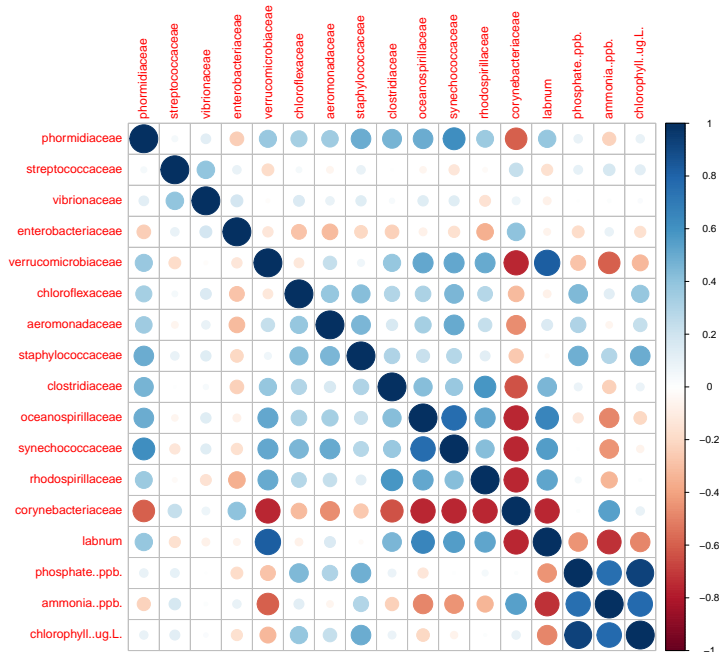

# Now let's have some fun

## Making a heat map

## A heat map

Spearman Correlations

# What next
